Origentity

FOR DESIGN CONSULTANTS

Specify clearly. Compare confidently. Preserve design intent.

Connect a neutral specification to suitable products—and to the actual batch delivered to your project.

Origentity gives consultants a central library for structured material requirements, manufacturer product information and supporting evidence. Start with the performance your design needs, then assess products against the relevant project and regional requirements.

SPECIFICATION

Start with requirements

Define properties, reference standards and acceptance criteria independently of a manufacturer.

PRODUCT SELECTION

Compare on evidence

Review suitable products against a common specification and their supporting documentation.

One reference from design to material verification

Neutral requirements → product selection → batch evidence → site review

Origentity

A CENTRAL LIBRARY FOR BETTER SPECIFICATIONS

Bring requirements and evidence into one place.

01 Create a neutral, reusable specification

Use the master specification as a structured starting point. Define the required technical properties, units, test methods and acceptance criteria. Assess multiple manufacturer products against the same requirements, helping keep selection transparent and technically consistent.

Retain the specification version used for the project. Record project-specific requirements and product selections so subsequent changes can be reviewed against the original design intent.

02 Review regional requirements and documents

Bring the applicable regional requirements together with product certificates, quality records, laboratory test reports, declarations and technical documentation. Review what is provided against what the specification requires, and identify gaps for clarification before acceptance.

Support European Construction Products Regulation (CPR) and Digital Product Passport (DPP) documentation, BABA origin evidence and relevant local requirements, according to the product and project.

03 Select with availability and sustainability in view

Check country availability and authorised distributor or direct-supply contacts. Review available Environmental Product Declarations (EPDs), life-cycle data and supporting environmental evidence alongside technical performance.

Origentity supports evidence management and assessment. Applicable requirements and document validity remain subject to professional review; a listing is not universal regulatory approval.

Origentity

FROM SPECIFICATION TO BATCH VERIFICATION

Keep the specified quality connected to delivery.

GMQR

Your requirements

Neutral master specification

PMQR

Selected product

Manufacturer data & documents

PQR

Delivered batch

Production identity & test records

The product record links to the master specification; the production QR links the batch or roll back to that product. Site teams can scan the PQR and review the delivered material against the relevant project specification and supporting evidence.

Maintain continuity in quality review

Distinguish declared product performance from batch-specific test evidence. Keep the selected specification version, product identity and available production records connected, helping teams investigate missing documents, mismatches or proposed substitutions.

Give consultants and clients a clearer record

Recorded verification and use can associate the material with a project, date and location. This supports traceable review, clearer handover information and later investigation of material questions—without losing the specification that guided selection.

Traceability depends on recorded scans and supplied evidence. QR verification supports, rather than replaces, required inspections, testing and professional acceptance.

Build your next specification on connected evidence.
